OUR SOLUTION

Quality Management System

Our connected hardware and software platform allows users to make better decisions with their data from crude testing operations. All existing analogue field testing devices are digitally connected, allowing users to pinpoint sources of deviation across all streams - increasing visibility into operations.

Digital Field Testing

Ensure you only pay fair value for the product you receive. Manage risk in your testing process by eliminating human error and improving your audit trail. Our Centrifuge Tube Reader digitizes results.

Connected In-Line Calibration

Never doubt your in-line calibration again. In real time, our system tells users when their in-lines need calibrating by performing time-synced comparisons between in-lines and scheduled field tests.
